Author has 2.7K answers and 3.7M answer views. The most obvious unsolved problem in Computer Science is the $P=NP$ problem. Very roughly speaking, "P" are problems that are easy to solve. (the number of operations is less than than some polynomial function of the problem's size.) "NP" are problems that are easy to check the answer.

It also outlines the construction of novel tools using techniques from discrete mathematics, particularly graph theory, which allowed problems to be solved that many had considered unsolvable. The book discusses a number of important problems in chemistry that have not been fully understood or fully appreciated, such as the notion of aromaticity and conjugated circuits, the generalized Hückel $4n + 2$

It also describes advantages of mathematical descriptors in QSAR, including their use in screening combinatorial libraries to search for structures with high similarity to the target compounds. Selected problems that this book addresses include: Multiple regression analysis (MRA) Insufficient use of partial ordering in chemistry The role of Kekulé valence structures The

problem of protein and DNA alignment Solved and Unsolved Problems of Structural Chemistry collects results that were once scattered in scientific literature into a thoughtful and compact volume. It sheds light on numerous problems in chemistry, including ones that appeared to have been solved but were actually only partially solved. Most importantly, it shows more complete solutions as well as methods and approaches that can lead to actualization of further solutions to problems in chemistry.

The investigation of three

problems, perfect numbers, periodic decimals, and Pythagorean numbers, has given rise to much of elementary number theory. In this book, Daniel Shanks, past editor of Mathematics of Computation, shows how each result leads to further results and conjectures. The outcome is a most exciting and unusual treatment. This edition contains a new chapter presenting research done between 1962 and 1978, emphasizing results that were achieved with the help of computers.

solutions by turning problems—and how we solve them—upside down. When we have a problem, most of us zero in, take it apart, and focus until we have it solved. David Niven shows us that focusing on the problem is exactly the wrong way to find an answer. Putting problems at the center of our thoughts shuts down our creative abilities, depletes stamina, and feeds insecurities. It's Not About the Shark shows us how to transform our daily lives, our work lives, and our family lives with a simple, but rock-solid principle: If you start by thinking about your problems, you'll never

make it to a solution. If you start by thinking about a solution, you'll never worry about your problems again. Through real-life examples and psychology research, David Niven shows us why:

- *Focusing on the problem first makes us 17 times less likely to find an answer
- *Being afraid of a problem is natural: we're biologically primed to be afraid
- *Finding a problem creates power – which keeps you from finding a solution
- *Working harder actually hides answers
- *Absolute confidence makes you less likely to find the answer
- *Looking away from a problem helps to see a solution

Inspired by Brown University's beloved course—The Entrepreneurial Process—Danny Warshay's See, Solve, Scale is a proven and paradigm-shifting method to unlocking the power of entrepreneurship. The Entrepreneurial Process, one of Brown University's highest-rated courses, has empowered thousands of

students to start their own ventures. You might assume these ventures started because the founders were born entrepreneurs. You might assume that these folks had technical or finance degrees, or worked at fancy consulting firms, or had some other specialized knowledge. Yet that isn't the case. Entrepreneurship is not a spirit or a gift. It is a process that anyone can learn, and that anyone can use to turn a problem into a solution with impact. In *See, Solve, Scale*, Danny Warshay, the creator of the Entrepreneurial Process course and founding

Executive Director of Brown's Center for Entrepreneurship, shares the same set of tools with aspiring entrepreneurs around the world. He overturns the common misconception that entrepreneurship is a hard-wired trait or the sole province of high-flying MBAs, and provides a proven method to identify consequential problems and an accessible process anyone can learn, master, and apply to solve them. Combining real-world experience backed by surprising research-based insights, *See, Solve, Scale* guides the reader through forming a successful startup

team and through the three steps of the process: find and validate a problem, develop an initial small-scale solution, and scale a long-term solution. It also details eleven common errors of judgment that entrepreneurs make when they rely on their intuition and provides instruction for how to avoid them. Leveraging Warshay's own entrepreneurship successes and his 15 years of experience teaching liberal arts students, *See, Solve, Scale* debunks common myths about entrepreneurship and empowers everyone, especially those who other entrepreneurship books have

People have always wanted answers to the big questions. Where did we come from? How did the universe begin? What is the meaning and design behind it all? Is there anyone out there? The creation accounts of the past now seem less relevant and credible. They have been replaced by a variety of what can only be called superstitions, ranging from

New Age to Star Trek. But real science can be far stranger than science fiction, and much more satisfying. I am a scientist. And a scientist with a deep fascination with physics, cosmology, the universe and the future of humanity. I was brought up by my parents to have an unwavering curiosity and, like my father, to research and try to answer the many questions that science asks us. I have spent my life travelling across the universe, inside my mind. Through theoretical physics, I have sought to answer some of the great questions. At one point, I thought I would

see the end of physics as we know it, but now I think the wonder of discovery will continue long after I am gone. We are close to some of these answers, but we are not there yet. The problem is, most people believe that real science is too difficult and complicated for them to understand. But I don't think this is the case. To do research on the fundamental laws that govern the universe would require a commitment of time that most people don't have; the world would soon grind to a halt if we all tried to do theoretical physics. But most people can understand and appreciate the basic

ideas if they are presented in a clear way with equations, which I believe is possible and which is something I have enjoyed trying to do throughout my life. I want to add my voice to those who demand why we must ask the big questions immediate action on the key challenges for our global community. I hope that going forward, even when I am no longer here, people with power can show creativity, courage and leadership. Let them rise to the challenges and act now.

Earth rotation was born in 1983 when Professor Raymond Hide suggested this topic to the special NATO panel of global transport mechanism in the Geosciences. Such a specialized meeting did not take place since the GEOP research conference on the rotation of the Earth and polar motion which was held at the Ohio State University (USA) in 1973. In the last ten years, highly precise measurements of the Earth's rotation parameters and new global geophysical data have become available allowing major advance to be made in the understanding of the various irregularities affecting the Earth's

rotation. The aim of the workshop was to bring together scientists who have made important contributions in this field during the last decade both at the observational and geophysical interpretation levels. The conference was divided into four main topics. The first session was dedicated to the definition, implementation and maintenance of the terrestrial and celestial reference systems. A few critical points have been identified as requiring further improvements: (i) appropriate selection of terrestrial sites recognized for their long term

presentation is organized around 24 central problems, many of which are accompanied by other, related problems. The authors place each problem in its historical and mathematical context, and the discussion is at the level of undergraduate mathematics. Each problem section is presented in two parts. The first gives an elementary overview discussing the history and both the solved and unsolved variants of the problem. The second part contains more details, including a few proofs of related results, a wider and deeper survey of what is known about the
